▲⟨1220⟩ ANALYTICAL PROCEDURE LIFE CYCLE

INTRODUCTION

This general chapter holistically considers the validation activities that take place across the entire life cycle of an analytical procedure and provides a framework for the implementation of the life cycle approach.

The analytical procedure life cycle approach described here is consistent with the quality by design concepts described in International Council for Harmonisation (ICH) guidelines. The procedure life cycle approach emphasizes the importance of sound scientific approaches and quality risk management for the development, control, establishment, and use of analytical procedures. Total error is used in this chapter; however, measurement uncertainty can also be used.

The procedure life cycle approach is applicable to all types of analytical procedures, and the extent of effort should be consistent with the complexity of the procedure and the criticality of the quality attribute to be measured. The life cycle approach can be considered optional, and any of the elements can be applied on the basis of how the procedure is used. Elements of the life cycle approach can also be applied retrospectively if deemed useful or in early stages of development with the appropriate modifications.

Elements of life cycle management of analytical procedures are also discussed in *Analytical Procedures and Methods Validation for Drugs and Biologics* (Guidance for Industry, FDA 2015).

Validation of an analytical procedure is the process by which it is established, through laboratory studies, that the performance of the procedure meets the requirements for the intended analytical applications. Validation, or demonstration that a procedure is suitable for the intended purpose, takes place during the entire procedure life cycle, beginning during the initial procedure design activities and extending through routine use. These activities include the formal procedure validation, verification, and transfer of procedures, as well as establishing and assuring adherence to an appropriate set of procedure controls and system suitability requirements.

The procedure life cycle is comprised of the analytical target profile (ATP) and three stages, which are introduced below and shown in *Figure 1*.

The ATP defines the criteria for the procedure performance characteristics that are linked to the intended analytical application and the quality attribute to be measured. It applies to all stages of the procedure life cycle. For quantitative procedures, the ATP describes the required quality of the reportable value since the reportable value generated using a qualified analytical procedure provides the basis for key decisions regarding compliance of a test article with regulatory, compendial, and manufacturing limits. The acceptable level of risk of making an incorrect decision can also be considered when establishing ATP criteria.

Stage 1: Procedure design encompasses procedure development, which consists of the analytical technology and sample preparation. It includes understanding gained through knowledge gathering, systematic procedure development experiments, and risk assessments and associated lab experiments. The output of *Stage 1* includes:

1. A set of procedure conditions that minimizes procedure bias to a suitable level, can provide acceptable precision, and can meet the ATP criteria
2. An understanding of the effect of procedure parameters (e.g., temperature, wavelength, flow rate, etc.) on procedure performance
3. Optimization of performance characteristics of the analytical procedure such as accuracy, precision, the appropriateness of any calibration model, specificity and limit of quantitation (as far as applicable); this includes a preliminary replication strategy for samples and standards
4. An initial analytical control strategy (ACS), which is a set of controls (system suitability tests [SSTs] and other procedure-specific controls) needed to ensure proper performance

Stage 2: Procedure performance qualification consists of studies designed to demonstrate that the procedure is suitable for its intended purpose. This involves confirmation that the reportable values generated by application of the analytical procedure meet the ATP criteria as well as confirmation of procedure performance characteristics through the traditional validation, verification, or transfer studies. Data generated during *Stage 1* can be used if available and suitable. At the end of *Stage 2*, the replication strategy and the performance of the procedure is confirmed to meet the ATP and other criteria.

Stage 3: Ongoing procedure performance verification involves monitoring the analytical procedure during routine use and confirming that the performance continues to meet ATP criteria. Monitoring ensures that the performance of the procedure is maintained at an acceptable level over the procedure lifetime. It can also provide an early indication of potential performance issues or adverse trends and aid in identifying required changes for the analytical procedure. Confirming procedure performance after changes ensures that the modified procedure will produce reportable values that meet the criteria defined in the ATP.

More details about the procedure life cycle are described in the subsequent sections.

Add the following:

▲⟨1210⟩ STATISTICAL TOOLS FOR PROCEDURE VALIDATION

1. INTRODUCTION

This chapter describes utilization of statistical approaches in procedure validation as described in *Validation of Compendial Procedures* ⟨1225⟩. For the purposes of this chapter, "procedure validation" refers to the analytical procedure qualification stage of the method life cycle, following design and development and prior to testing.

Chapter ⟨1225⟩ explains that capabilities of an analytical procedure must be validated based on the intended use of the analytical procedure. Chapter ⟨1225⟩ also describes common types of uses and suggests procedure categories (I, II, III, or IV) based on the collection of performance parameters appropriate for these uses. Performance parameters that may need to be established during validation include accuracy, precision, specificity, detection limit [limit of detection, (LOD)], quantitation limit, linearity, and range. In some situations (e.g., biological assay), relative accuracy takes the place of accuracy. This chapter focuses on how to establish analytical performance characteristics of accuracy, precision, and LOD. For quantitative analytical procedures, accuracy can only be assessed if a true or accepted reference value is available. In some cases, it will be necessary to assess relative accuracy. In many analytical procedures, precision can be assessed even if accuracy cannot be assessed. The section addressing LOD can be applied to limit tests in Category II.

The other analytical performance characteristics noted in ⟨1225⟩, which include specificity, robustness, and linearity, are out of scope for this chapter.

Because validation must provide evidence of a procedure's fitness for use, the statistical hypothesis testing paradigm is commonly used to conduct validation consistent with ⟨1225⟩. Although some statistical interval examples are provided in *3. Accuracy and Precision*, these methods are not intended to represent the only approach for data analysis, nor to imply that alternative methods are inadequate.

Table 1 provides terminology used to describe an analytical procedure in this chapter. The definitions for individual determination and reportable value are in alignment with *General Notices, 7.10 Interpretation of Requirements*.

Table 1. Analytical Procedure Validation Terminology

Terminology	Description
Laboratory sample	The material received by the laboratory
Analytical sample	Material created by any physical manipulation of the laboratory sample, such as crushing or grinding
Test portion	The quantity (aliquot) of material taken from the analytical sample for testing
Test solution	The solution resulting from chemical manipulation of the test portion such as chemical derivatization of the analyte in the test portion or dissolution of the test portion
Individual determination (ID)	The measured numerical value from a single unit of test solution
Reportable value	Average value of readings from one or more units of a test solution

Not all analytical procedures have all stages shown in *Table 1*. For example, liquid laboratory samples that require no further manipulations immediately progress to the test solution stage. Demonstration that a reportable value is fit for a particular use is the focus of analytical validation.

Table 2 provides an example of the *Table 1* terminology for a solid oral dosage form.

Table 2. Example for Coated Tablets

Terminology	Description	
Laboratory sample	100 coated tablets	
Analytical sample	20 tablets are removed from the laboratory sample and are crushed in a mortar and pestle	
Test portion	Replicate 1: 1 g of crushed powder aliquot from the analytical sample	Replicate 2: 1 g of crushed powder aliquot from the analytical sample

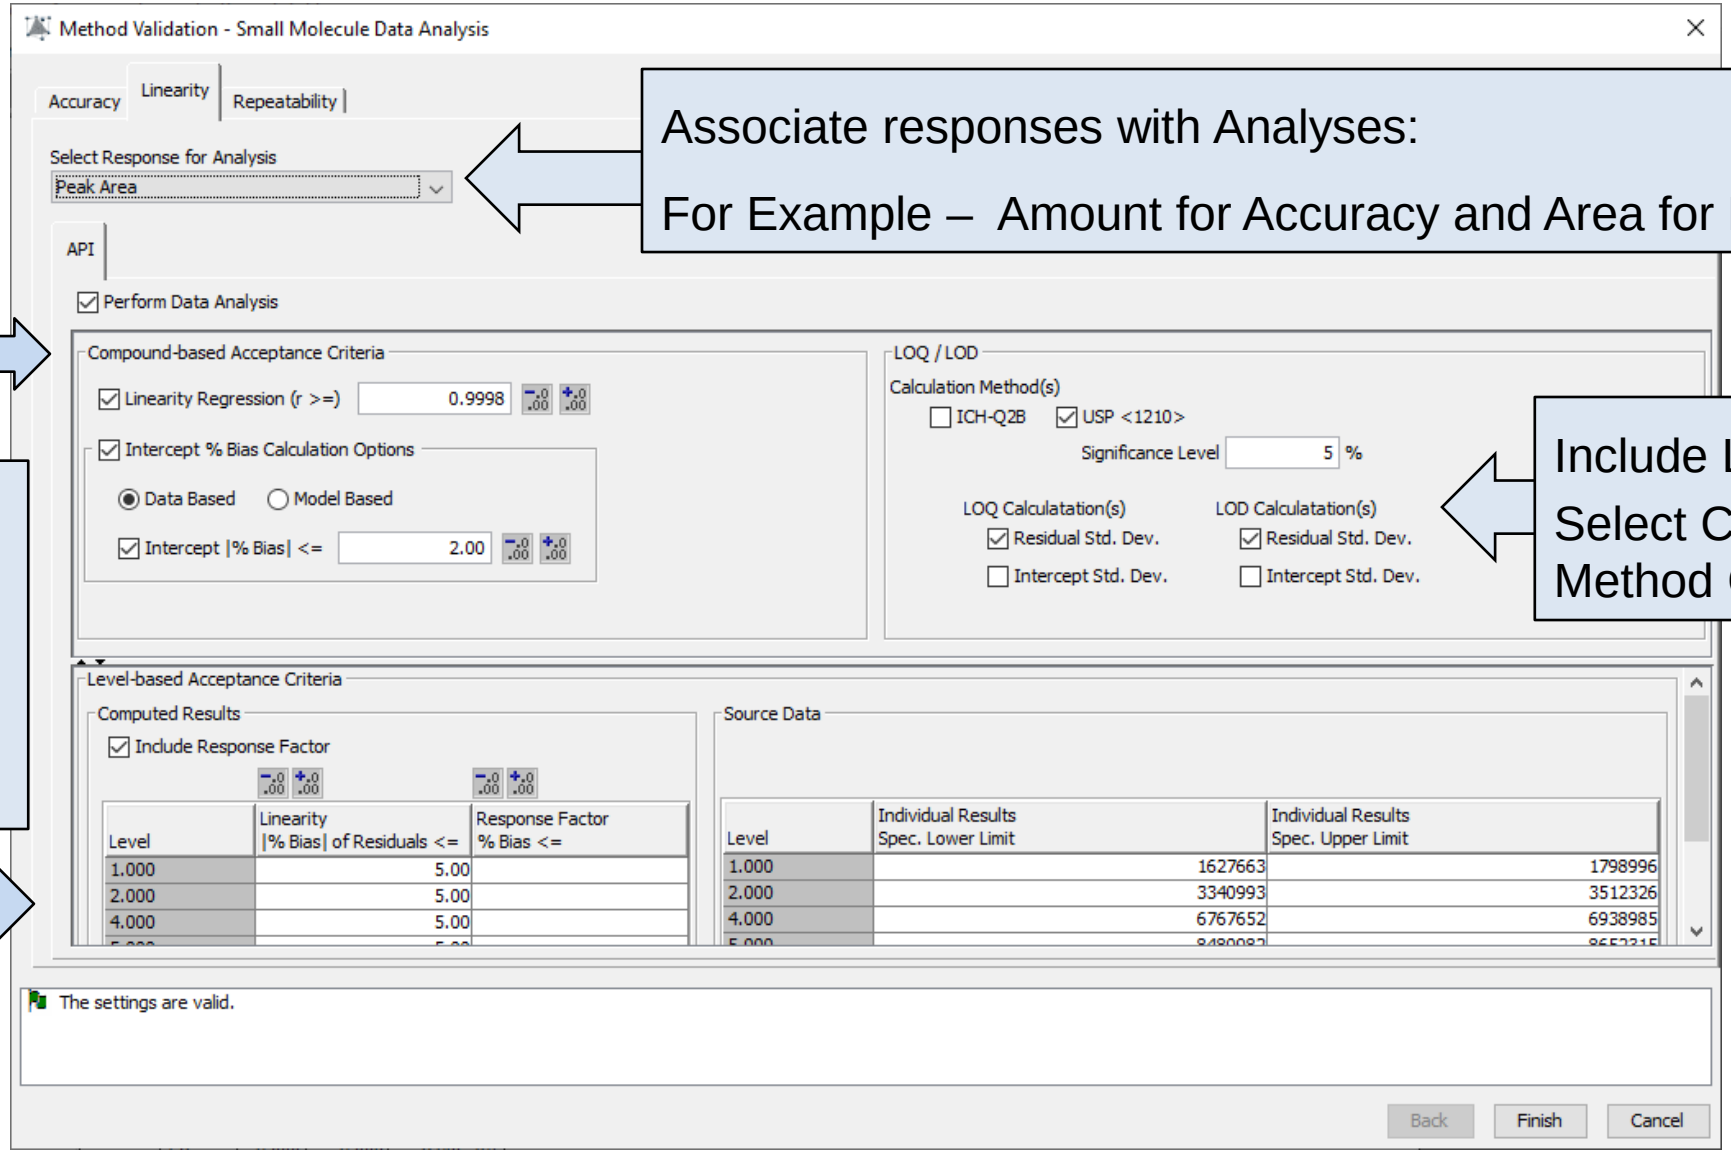
4. Analysis Wizard for CDS Imported Results



Associate responses with Analyses:

For Example – Amount for Accuracy and Area for Linearity.

Include LOQ and LOD.

Select Calculation Method Options.

Set Global and Level-specific Acceptance Criteria, including Spec Limits for Data

5. Instant Analysis, Graphing, and Reporting

ICH Q2(R2):

Data derived from the regression line may help to provide mathematical estimates of the linearity. A plot of the data, the correlation coefficient or coefficient of determination, y-intercept and slope of the regression line should be provided. An analysis of the deviation of the actual data points from the regression line is helpful for evaluating linearity (e.g., for a linear response, the impact of any non-random pattern in the residuals plot from the regression analysis should be assessed).

2. CONSIDERATIONS PRIOR TO VALIDATION

How many individual determinations will compose the reportable value, and how will they be aggregated?

- To answer this question, it is necessary to understand the contributors to the procedure variance and the ultimate purpose of the procedure. **Estimation of variance components** during pre-validation provides useful information for making this decision.

Replication Strategy Optimization

Robust Final LC Method → **Replication Strategy Optimization** → **APLM Stage 2**

ICH Q14

Reportable Result: the result as generated by the analytical procedure after calculation or processing and applying the described sample replication. *(ICH Q2)*

ICH Q2(R2)

The experimental design of the validation study should reflect the number of replicates used in routine analysis to generate a reportable result.

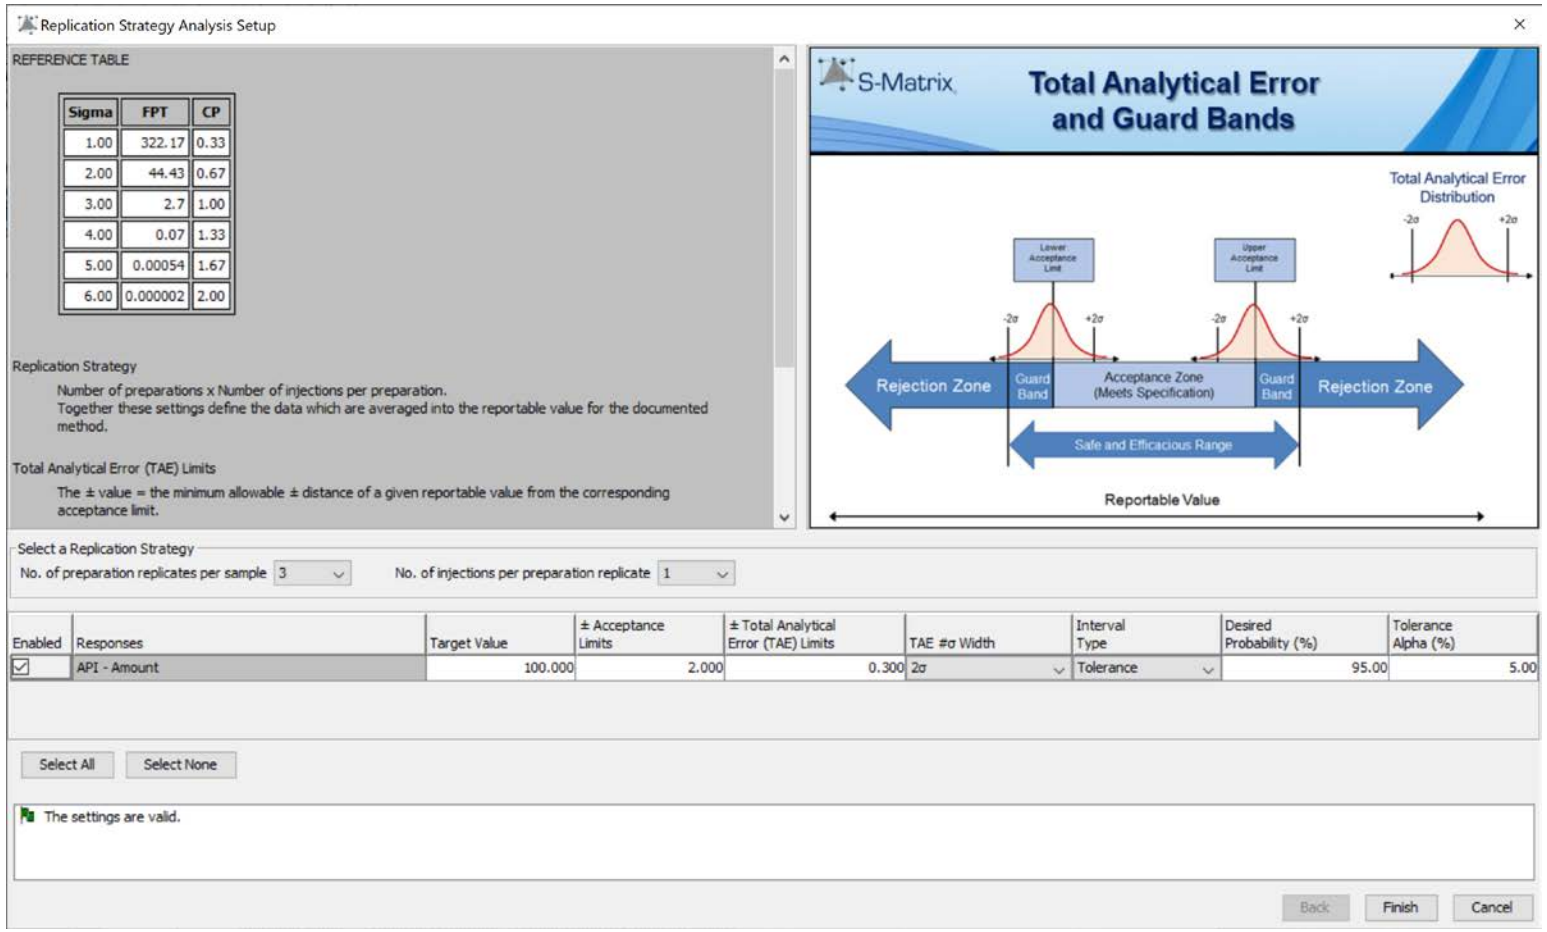
USP <1220>

Stage 1:

Optimization of performance characteristics of the analytical procedure such as accuracy, precision, …; this includes a preliminary replication strategy for samples and standards.

Replication Strategy Experiment

Define your Proposed Replication Strategy, Target Result Value, Acceptance Limits, Desired TAE Limits, and your Desired Probability and Tolerance (Confidence Interval).



Replication Strategy for the Reportable Value

Between Variables Components of Variation

Variable Name	Variance	Standard Deviation	Degrees of Freedom	t-table Value	(+/-) 95% Confidence Limits	Error Contribution (%)
Sample Preparation	0.008	0.092	4	2.7764	0.25	94.17
Injection	0.001	0.023	20	2.0860	0.04	5.83

Overall Error in a Single Determination

Statistic	Value
Mean	100.051
Variance	0.009
Standard Deviation	0.094
% RSD	0.094

TOST Analysis Results Summary

Statistic	Value	Pass/Fail
TAE Width (2σ) - Target	±0.300	
Computed TAE Width (2σ)	±0.156	Pass
FPT	<0.0001	
Cp	12.2271	
Variance	0.003	
Standard Deviation	0.055	
% RSD	0.05	
% CV	0.05	

Tolerance Interval Analysis Results

Interval Setting	Value	Number of Preparations	Number of Injections per Preparation
Target	100.000	3	1
Acceptance Limits	±2.000		
Desired Probability %	95.00		
Tolerance Alpha %	5.00		
Grand Mean	100.051		
Computed Tolerance Interval	±0.293	Pass	
Required Guard Band Width	±0.300		

The computed Tolerance Interval falls within the defined Total Analytical Error Limits.

Replication Strategy for the Reportable Value

Fusion QbD reports the Components of Variation and the Corresponding % Contributions to Total Analytical Error.

Between Variables Components of Variation

Variable Name	Variance	Standard Deviation	Degrees of Freedom	t-table Value	(+/-) 95% Confidence Limits	Error Contribution (%)
Sample Preparation	0.008	0.092	4	2.7764	0.254	94.17
Injection	0.001	0.023	20	2.0860	0.048	5.83

Overall Error in a Single Determination

Statistic	Value
Mean	100.051
Variance	0.009
Standard Deviation	0.094
% RSD	0.094

Fusion QbD also reports the TOST Results (Traditional Precision Only) and the USP <1210> Interval Results (Combined Precision + Bias).

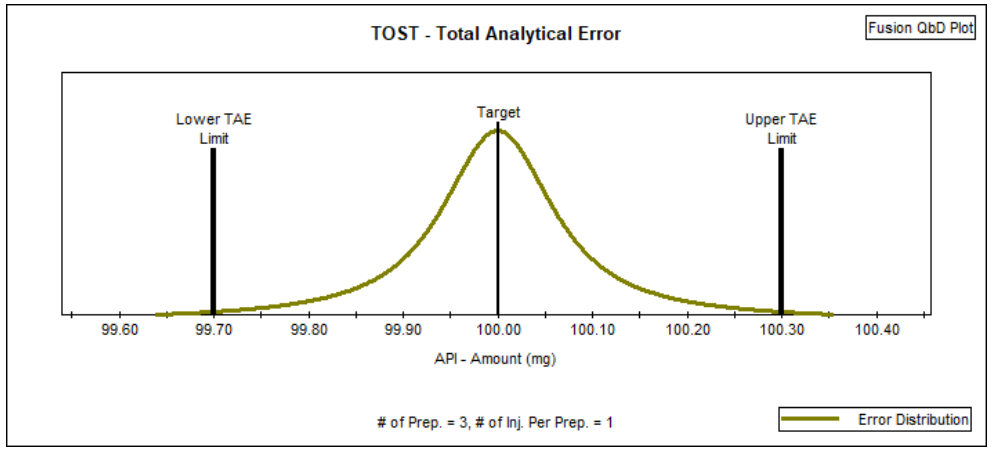
TOST Analysis Results Summary

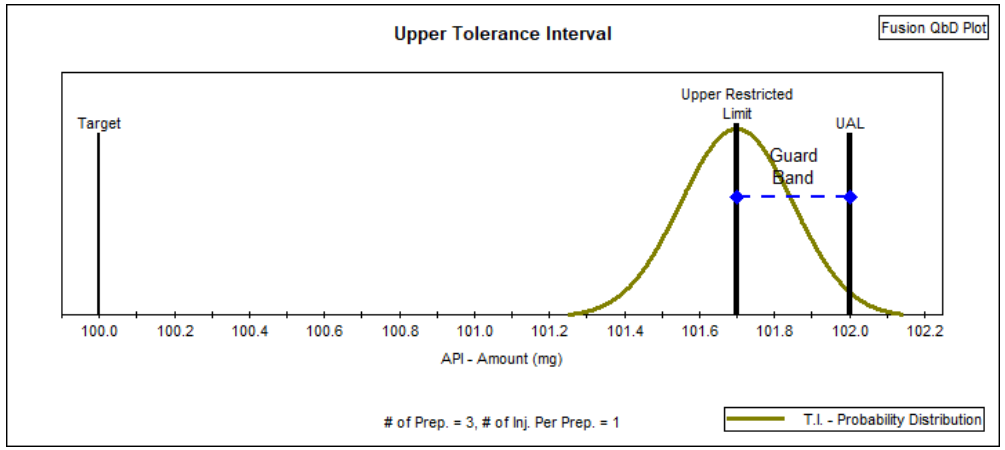
Statistic	Value	Pass/Fail
TAE Width (2σ) - Target	±0.300	
Computed TAE Width (2σ)	±0.156	Pass
FPT	<0.0001	
Cp	12.2271	
Variance	0.003	
Standard Deviation	0.055	
% RSD	0.05	
% CV	0.05	

Tolerance Interval Analysis Results

Interval Setting	Value	Number of Preparations	Number of Injections per Preparation
Target	100.000	3	1
Acceptance Limits	±2.000		
Desired Probability %	95.00		
Tolerance Alpha %	5.00		
Grand Mean	100.051		
Computed Tolerance Interval	±0.293	Pass	
Required Guard Band Width	±0.300		

The computed Tolerance Interval falls within the defined Total Analytical Error Limits.





All the Critical QbD Capabilities You Need

Critical QbD Capability	FMV

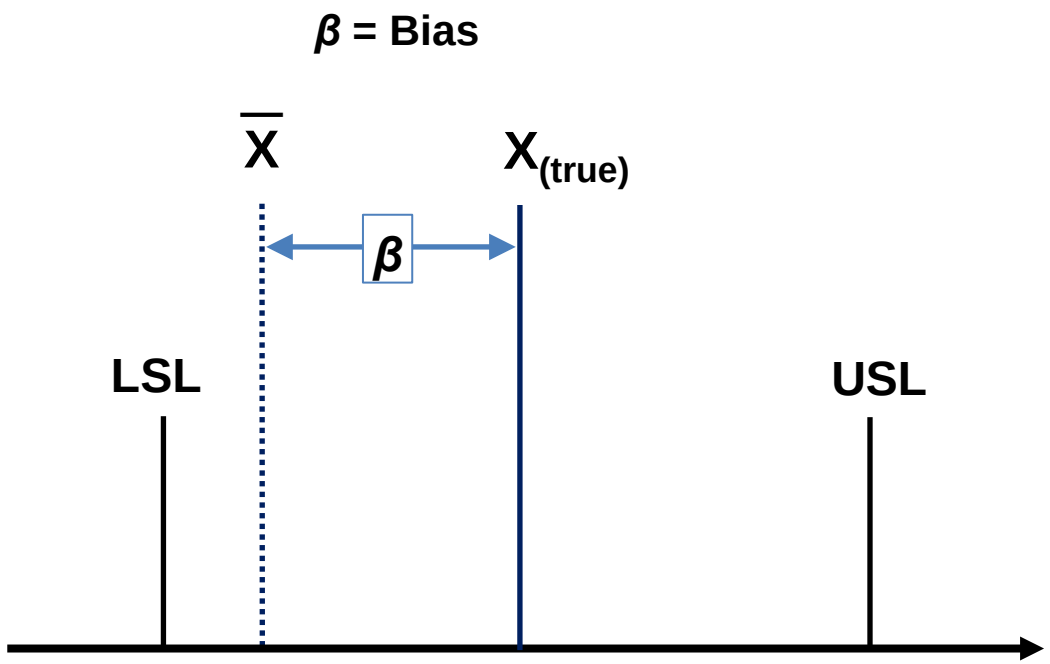
- Replication Strategy and Total Analytical Error
- **Accuracy and Repeatability**
- Analytical Method Transfer

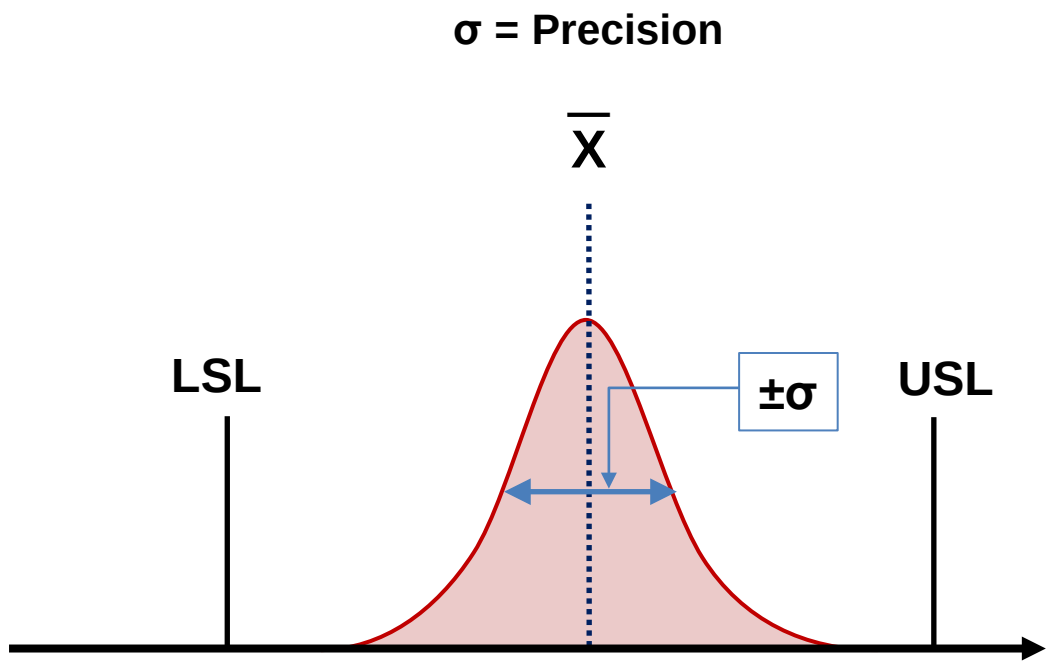
<1210> Statistical Tools for Procedure Validation

3. ACCURACY AND PRECISION

3.2 Combined Validation of Accuracy and Precision

The illustration below shows that the method will pass System Suitability performance for the Critical Quality Attribute (CQA) being tested SST when Accuracy (***β* – bias estimate**) and Precision (**σ – variation estimate**) **are assessed independently (= High Risk Approach).**





<1210> Statistical Tools for Procedure Validation

3. ACCURACY AND PRECISION

3.2 Combined Validation of Accuracy and Precision

However, as the illustration below shows – the method does not have acceptable System Suitability performance for the Critical Quality Attribute (CQA) being tested when both Accuracy (*β* – bias estimation) and Precision (σ – variation estimation) **are assessed together (= Low Risk Approach).**

- **Analytical Method Transfer**

USP ⟨ 1224⟩ – Transfer of Analytical Procedures

Comparative Testing

Comparative testing requires the analysis of a predetermined number of samples of the same lot by both the sending and the receiving units. Other approaches may be valid, e.g., if the receiving unit meets a predetermined acceptance criterion for the recovery of an impurity in a spiked product. Such analysis is based on a preapproved transfer protocol that stipulates the details of the procedure, the samples that will be used, **and the predetermined acceptance criteria, including acceptable variability**. Meeting the predetermined acceptance criteria is necessary to assure that the receiving unit is qualified to run the procedure.

Analytical Method Transfer Example

Transferring Lab

Fusion QbD Sequence Execution

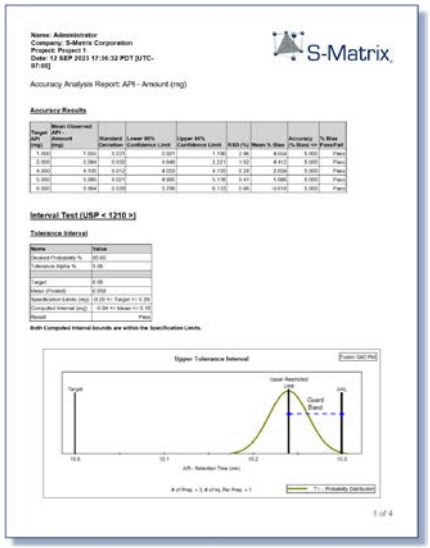
Fusion QbD Sequence Execution

Receiving Lab

Chromatography Data Software

ALR Design

Chromatogram Results Data



1. Fusion QbD – Exports experiment to the CDS as Ready-to-Run sequence, methods, standards
2. Sequence is run at both labs.
3. Fusion QbD – Imports results for instant and complete analysis and reporting.

Key Benefits of FMV

1. **Consistency – Workflow and Reporting.**

   Work is standardized – done the same way every time. Reporting is standardized, complete, easy to communicate.

2. **Simplicity**

   Tremendous ease of use. Very brief learning curve. Clearly defined templatable workflows with built-in workflow management.

3. **Speed (Productivity)**

   Automation and simplified workflows dramatically increase productivity. Review process is minimized and simplified.

4. **Regulatory Alignment and Completeness**

   All required validation experiment types are supported. Reporting meets regulatory requirements. Reports can be attached to Project specific narrative documents.

Key Benefits of FMV

5. **Platform Independence**

   Support for Empower, ChemStation, and Chromeleon means that the standardized workflows and reporting can be easily extended to users of other platforms at other sites or other companies (e.g. CMOs).

6. **Customer Support**

   Our support is top-rated worldwide. S-Matrix and our local distributors have a multi-year history of proven ability to meet all our customer's support needs.
